

Gurung Durga

Senior Full Stack Java Developer

GC EAD | (646) 512-9491 | gurungd1231@outlook.com

LinkedIn: [LinkedIn Profile](#)

PROFESSIONAL SUMMARY:

- Senior Full Stack Java Engineer with **8+ years** of experience designing, developing, and delivering scalable cloud-native enterprise applications across banking, healthcare, retail analytics, and media domains. Expertise in architecting distributed microservices solutions using Java 8–17, Spring Boot, Spring Cloud, and event-driven systems deployed on AWS and Kubernetes platforms.
- Strong experience building high-availability systems using Docker, Kubernetes, Kafka, Redis, and secure API architectures leveraging OAuth2, JWT, RBAC, and Zero Trust Security principles. Skilled in observability engineering, distributed tracing, CI/CD automation, Infrastructure as Code, and production reliability optimization.
- Hands-on experience developing responsive frontend applications using React, Redux, Angular, and modern JavaScript frameworks integrated with RESTful and event-driven backend services. Adept at collaborating with cross-functional Agile teams, driving cloud modernization initiatives, and implementing scalable enterprise solutions aligned with modern DevOps and SRE practices.

TECHNICAL SKILLS:

- **Languages** - Java (8–17), J2EE, TypeScript, JavaScript (ES6+), SQL, PL/SQL, HTML5, CSS3, SCSS
- **Backend Frameworks & Architecture** - Spring Boot, Spring MVC, Spring Cloud, Hibernate, JPA, Spring Security, Resilience4j, WebFlux, Reactive Streams, gRPC, RESTful APIs, SOAP Web Services, OpenAPI 3.0, API Governance, Contract Testing, Microservices Architecture, Distributed Systems
- **Frontend Technologies** - React, Redux, Angular (12+), RxJS, Angular Material, Reactive Forms, TypeScript, Single Page Applications (SPA), Node.js, Express.js, Bootstrap, jQuery, AJAX, Webpack, Babel, Responsive UI Design, Lazy Loading, Component Libraries
- **Cloud & Infrastructure** - AWS (EC2, S3, RDS, ECS, EKS, ELB, IAM, CloudWatch, Route 53, CloudFormation, Auto Scaling), Docker, Kubernetes, Helm, Istio Service Mesh, ArgoCD, GitOps, Terraform Modules, Infrastructure as Code (Terraform, CloudFormation), Pivotal Cloud Foundry (PCF)
- **Messaging & Event Streaming** - Apache Kafka, RabbitMQ, AWS SQS, ActiveMQ, IBM MQ, JMS, Event-Driven Architecture
- **Databases & Caching** - Oracle, PostgreSQL, MySQL, DB2, MongoDB, Cassandra, Elasticsearch, Redis, EHCACHE
- **DevOps & CI/CD** - Jenkins, GitHub Actions, Maven, Gradle, Nexus, SonarQube, Git, Bitbucket, SVN, Blue/Green Deployments, Canary Releases, Automated Pipelines, SRE Practices
- **Monitoring & Observability** - ELK Stack (Elasticsearch, Logstash, Kibana), Prometheus, Grafana, OpenTelemetry, Distributed Tracing, AWS CloudWatch, Centralized Logging & Monitoring
- **Testing & Quality Engineering** - JUnit, Mockito, TestNG, Selenium, Cucumber (BDD), JMeter, Karma, Jasmine, Mocha, Chai, Protractor, Automated Regression Testing, Code Coverage Optimization
- **Security** - OAuth 2.0, JWT, RBAC, Spring Security, SSL/TLS, IAM Policies, Zero Trust Security, Secure API Design
- **AI & Intelligent Systems** - AI-powered Observability, ML-based Analytics, OpenAI APIs, LangChain, RAG (Retrieval-Augmented Generation), Vector Databases, Intelligent Search & Monitoring Solutions
- **Methodologies & Tools** - Agile (Scrum), TDD, BDD, CI/CD, DevOps, Domain-Driven Design (DDD), IntelliJ IDEA, Eclipse, Spring Tool Suite, JIRA, Confluence
- **Operating Systems** - Linux, Windows, macOS

• Certifications

- AWS Certified Cloud Practitioner – Amazon Web Services (AWS)

PROFESSIONAL EXPERIENCE:

Santander Bank — Senior Java Full Stack Developer

Boston, Massachusetts | Feb 2024 – Present

Project Summary

Leading modernization of a legacy banking platform into a cloud-native distributed microservices ecosystem using Java 17, Spring Boot, AWS, and Kubernetes supporting over 2M+ daily financial transactions. Designed scalable containerized services deployed on Amazon EKS with Kafka-driven event processing, Redis caching, secure API gateways, and enterprise observability solutions.

Key Contributions

- Architected scalable cloud-native microservices using Java 17, Spring Boot, and Spring Cloud supporting 2M+ daily banking transactions.
- Designed AWS multi-AZ infrastructure including VPC, IAM, ELB, Route 53, and private/public subnet architecture improving platform resiliency and security.
- Developed responsive Angular-based banking dashboards and transaction management interfaces integrated with Spring Boot microservices and secure REST APIs.
- Implemented Angular reactive forms, RxJS observables, and reusable UI components improving frontend scalability and real-time transaction processing workflows.
- Optimized Angular application performance using lazy loading, modular architecture, and component-level optimization reducing frontend response times.
- Integrated OAuth2 and JWT-based authentication mechanisms within Angular applications ensuring secure enterprise-grade user access management.
- Deployed containerized applications using Docker, Kubernetes, Helm, and Horizontal Pod Autoscaling enabling dynamic scaling during peak banking workloads.
- Implemented Kafka-based event-driven transaction processing pipelines ensuring reliable asynchronous communication across distributed services.
- Improved API response latency by 70% using Redis distributed caching and database optimization strategies.
- Built centralized observability and monitoring solutions using OpenTelemetry, Prometheus, Grafana, ELK Stack, and distributed tracing improving incident management and root-cause analysis.
- Configured Istio service mesh within Kubernetes clusters enabling secure service-to-service communication, traffic routing, and observability enhancements.
- Implemented high-performance inter-service communication using gRPC for low-latency distributed transaction processing.
- Designed Blue-Green and Canary deployment strategies using Jenkins, Kubernetes, and ArgoCD improving release reliability and deployment automation.
- Strengthened platform security using Zero Trust Security principles, OAuth2, JWT, RBAC, and AWS KMS encryption.
- Improved automated testing coverage from 60% to 85% using JUnit, Mockito, and integration testing frameworks significantly reducing production defects.
- Collaborated with SRE and DevOps teams to improve SLA compliance, production reliability, and incident response automation.
- Designed scalable multi-tenant microservices architecture supporting secure enterprise client isolation.
- Integrated AI-powered observability and ML-driven anomaly detection workflows for proactive monitoring and transaction failure analysis.

CaroMont Health — Java Developer

Gastonia, NC | Apr 2022 – Jan 2024

Project Summary

Modernized healthcare analytics systems into scalable cloud-native microservices platforms using Java, Spring Boot, Docker, Kubernetes, and AWS to support secure patient data processing and real-time healthcare analytics.

Key Contributions

- Migrated legacy monolithic healthcare applications into Spring Boot microservices improving scalability and maintainability.
- Developed Angular-based healthcare dashboards and reporting interfaces for real-time patient analytics and clinical data visualization.
- Implemented responsive frontend components and REST API integrations improving usability and accessibility across healthcare reporting platforms.
- Designed Kafka-based event streaming pipelines enabling real-time ingestion of healthcare and clinical data streams.
- Implemented dead-letter queues and retry mechanisms improving reliability of healthcare data processing workflows.
- Containerized applications using Docker and orchestrated deployments through Kubernetes clusters.
- Implemented HIPAA-compliant security frameworks using AWS KMS encryption, TLS security, IAM policies, and secure API standards.
- Automated infrastructure provisioning using Terraform Modules and AWS CloudFormation enabling consistent multi-environment deployments.
- Built centralized logging and monitoring solutions using ELK Stack, CloudWatch, and distributed tracing tools.
- Improved ETL processing efficiency by 45% using Spring Batch optimization and performance tuning techniques.
- Performed JVM tuning, caching optimization, and database query improvements for high-volume healthcare datasets.
- Integrated AI/ML-based healthcare analytics services enabling predictive reporting and intelligent patient data insights.
- Implemented intelligent monitoring and anomaly detection workflows improving operational visibility across distributed healthcare systems.

Crossmark — Java Full Stack Developer

Plano, TX | Feb 2020 – Mar 2022

Project Summary

Developed cloud-based retail analytics and merchandising platforms using Java, Spring Boot, React, Redux, AWS, and Kubernetes supporting real-time retail execution analytics and enterprise reporting systems.

Key Contributions

- Developed full-stack enterprise analytics applications using Java, Spring Boot, React, and Redux supporting real-time business dashboards.
- Optimized React application performance using React Hooks, Redux state management, lazy loading, and reusable component architecture.
- Designed domain-driven microservices architecture for retail analytics, transaction processing, and reporting services.
- Implemented asynchronous event-driven workflows using AWS SQS improving scalability and transaction processing efficiency.
- Deployed Docker containerized services through Kubernetes clusters ensuring high availability and platform scalability.
- Configured AWS infrastructure including EC2, Auto Scaling Groups, and Elastic Load Balancers maintaining 99.9% uptime.
- Developed responsive and accessible frontend UI components supporting cross-device compatibility and enterprise dashboard usability.

- Enhanced frontend maintainability through modular component libraries and improved state management practices.
 - Implemented distributed tracing using Zipkin reducing microservice debugging and issue resolution time by 35%.
 - Optimized database performance through query tuning, indexing strategies, and connection pooling reducing latency by 50%.
 - Developed CI/CD pipelines using Jenkins and GitHub Actions enabling automated builds, testing, and deployments.
 - Automated regression testing pipelines reducing QA validation effort by 40% and accelerating release cycles.
 - Strengthened application security against OWASP vulnerabilities using static code analysis and secure coding practices.
-

TD SYNnex — Software Engineer

Fremont, California | Jan 2018 – Jan 2020

Project Summary

Contributed to enterprise media and content management platforms using Java, Spring MVC, Hibernate, REST/SOAP services, and CI/CD automation supporting large-scale enterprise integrations and secure deployment workflows.

Key Contributions

- Developed enterprise J2EE applications using Spring MVC, Hibernate, REST APIs, and SOAP Web Services.
 - Refactored legacy monolithic components into modular Spring-based services improving maintainability and scalability.
 - Optimized Hibernate ORM mappings, DAO layers, and SQL queries improving backend performance and database efficiency.
 - Designed REST APIs with Swagger/OpenAPI documentation improving third-party system integration.
 - Improved PL/SQL performance through indexing strategies, query optimization, and stored procedure tuning.
 - Implemented Spring Security RBAC authentication frameworks securing enterprise APIs and web applications.
 - Automated build and deployment pipelines using Jenkins, Maven, and Ant reducing manual deployment effort.
 - Built centralized logging solutions using Log4j and structured JSON logging improving production diagnostics.
 - Performed performance and load testing using JMeter validating scalability under high-traffic workloads.
 - Assisted DevOps and release engineering teams improving deployment stability and reducing release failures by 70%.
-

EDUCATION

Bachelor of Science in Computer Science

Queens College, City University of New York
